Unsubscribely

*Programmable subscription payments on Algorand***5:00**

DURATION

10

SEGMENTS

5

VAULT TYPES

SEG 01 0:00 – 0:30 The Hook

SCREEN → Black screen. Voice only. No app for first 8 seconds. Then fade in landing page, slow scroll.

Every month, money leaves your account without a single conscious decision from you. Subscriptions you forgot. Services still charging you.

And every one of those payments? Not recorded anywhere you actually own. No contract on-chain. No receipt that lasts. No conditions. No agent watching for you.

This is Unsubscribely — a DeFi platform that puts subscription payments on Algorand. Not just tracked — governed. Locked in smart contracts. Released by an autonomous agent. Not manually.

SEG 02 0:30 – 1:00 Landing Page Walk

SCREEN → Scroll Features section. Pause 2s on Escrow Vault card, then Agent card. Click "Get Started". Log in.

Four layers. A subscription tracker. On-chain escrow vaults — five types, each with different release conditions. An autonomous payment agent — a wallet that executes payments on-chain every day. And an AI spending optimizer. Let me show you the real thing.

NOTE: Pre-logged in. Wallet on Testnet. 4+ subscriptions added. One locked vault, one released vault ready.

SEG 03 1:00 – 1:30 Dashboard Overview

SCREEN → Pan over dashboard metrics. Hover monthly spend. Scroll to subscription cards. Navigate to Subscriptions → Add New → Adobe CC · \$54.99 · Monthly. Save.

The dashboard — full subscription footprint. Monthly spend, billing dates, active vaults, live agent activity.

Four subscriptions already here — Netflix, Spotify, GitHub, Figma. I'll add one more. Adobe Creative Cloud. Any service, any currency, any billing cycle. Takes seconds.

Now watch what we do with it.

SEG 04 1:30 – 2:45 Creating an Escrow Vault

SCREEN → Escrow Vaults → Create Vault → Standard · Adobe CC · 5 ALGO · recipient address → Create → sign wallet → Fund → sign → LOCKED status → click Lora link → show txn 8s → return.

I'm locking funds inside a smart contract on Algorand. Not a database entry. Not a company's promise. An actual on-chain contract — immutable, trustless, auditable by anyone.

Funded and locked. Five ALGO is now inside the smart contract. Not in my wallet. Not in anyone's database. On-chain. Waiting.

Look at Lora — the contract address, the amount, the ABI call. This is real. Anyone can verify it right now.

SEG 05 2:45 – 3:15 **Five Vault Types**

SCREEN → Open Create Vault modal. Cycle through each vault type – pause 4s on each to show unique fields. Do not create any. Close modal.

Five vault types. Five programmable trust models.

Standard — creator locks, agent or creator releases. **Time-Locked** — funds can't move before a date, contract-enforced not policy. **Multi-Sig** — two wallets must agree before release. **Dispute-Resolution** — third-party arbitrator can intervene. **ASA-based** — lock any Algorand Standard Asset, not just native ALGO.

All enforced by TEAL on the AVM. No middleman. No override possible.

SEG 06 3:15 – 4:00 **The Autonomous Agent**

SCREEN → Dashboard → scroll to Agent Activity panel → point at ON-CHAIN badge → highlight an entry with timestamp → click its Lora link → show agent wallet · release() call · inner ALGO payment → hold 6s → return.

This is what makes Unsubscribely different from every other subscription tracker.

There is a **dedicated Algorand wallet** — the agent — running every day at midnight UTC. It scans due subscriptions. Finds the linked vault. Calls **release()** on the contract. ALGO moves to the recipient. **No user click. No reminder. Fully autonomous.**

The agent wallet signed this transaction. Submitted it. ALGO moved. Publicly verifiable on Lora — the method call, the amount, the addresses. Every action timestamped with direct on-chain proof.

NOTE: If no agent action yet — open the locked vault's detail page, show App ID on Lora, explain agent releases it autonomously at next billing date.

SEG 07 4:00 – 4:15 **ARC-3 NFT Receipt**

SCREEN → Vault Details of released vault → Mint NFT Receipt → sign → show receipt card: name, amount, timestamp, ASA ID.

After a vault releases, mint an **ARC-3 NFT receipt** — an immutable on-chain record of the payment. Name, amount, subscription, timestamp — all in the NFT metadata.

Your payment history isn't in a database someone controls. It's on Algorand. Permanently.

SEG 08 4:15 – 4:35 **AI Spending Optimizer**

SCREEN → AI Optimizer page → Run Analysis → wait → show risk scores, recommendations, spend health score.

Locking money on-chain creates a natural audit trail — and the AI optimizer reads it. Powered by Gemini. Analyzes your full portfolio. Surfaces duplicate spending, high-risk services, underused plans.

Specific recommendations — what to cancel, what to downgrade — based on actual vault data and billing patterns. Not generic advice.

SEG 09 4:35 – 4:50 **On-Chain Resume**

SCREEN → On-Chain Resume page → show resume: vaults, total paid, NFT count → show public URL in address bar.

Every wallet has a public on-chain resume — shareable, verifiable view of your entire Algorand payment history. Vault count, total ALGO moved, NFT receipts minted. Anyone can verify every record on-chain.

Permanent. Trustless. Yours.

SEG 10 4:50 – 5:00 **Close**

SCREEN → Cut to landing hero. Hold 5s. Fade to black with logo centered.

Unsubscribely. **Programmable money. Transparent payments. Autonomous delivery.**

This is what subscription payments look like when they belong to you.

Shot-by-Shot Production Table

USE THIS DURING RECORDING — EVERY ACTION MAPPED TO THE SECOND

TIME	SCREEN	ACTION	VOICEOVER / WORDS
01 — THE HOOK			
0:00	Black screen	Voice only. No visual.	"Every month, money leaves your account without a single conscious decision from you..."
0:08	Landing — Hero	Fade in. Slow scroll down.	"...subscriptions still charging you. Services you forgot. Every payment — not recorded anywhere you actually own."
0:18	Landing — Features	Scroll to features section.	"No contract on-chain. No receipt that lasts. No agent watching for you."
0:26	Landing — Features	Pause on Escrow Vault card.	"This is Unsubscribely — a DeFi platform that puts subscription payments on Algorand. Governed. On-chain."
02 — LANDING PAGE			
0:30	Landing — Features	Hover Escrow card, then Agent card.	"Four layers: subscription tracker, on-chain escrow vaults, an autonomous agent, and an AI optimizer."
0:43	Landing	Click "Get Started".	"Let me show you the real thing."
0:47	Auth / Login	Log in. Wallet auto-connects.	[Pause — no voiceover]
03 — DASHBOARD			
1:00	Dashboard	Pan over metrics. Hover monthly spend.	"Full subscription footprint — monthly spend, billing dates, active vaults, agent activity."
1:10	Subscription list	Scroll to subscription cards.	"Netflix, Spotify, GitHub, Figma. Billing dates and vault status visible at a glance."
1:18	Subscriptions page	Navigate. Click "Add Subscription".	"I'll add one more — Adobe Creative Cloud."
1:22	Add form	Fill: Adobe CC · \$54.99 · Monthly. Save.	"Any service, any currency, any billing cycle."
1:28	Subscription list	Adobe CC appears. Pause 2s.	"Now watch what we do with it."
04 — ESCROW VAULT CREATION			
1:32	Escrow Vaults	Navigate. Click "Create Vault".	"Locking funds inside a smart contract on Algorand. Not a database entry — an actual on-chain contract."
1:42	Create Vault modal	Standard · Adobe CC · 5 ALGO · recipient.	"Immutable, trustless, auditable by anyone."
1:52	Wallet popup	Click Create. Sign transaction.	"Deploying to Algorand Testnet..."
2:00	Vault — unfunded	Vault appears. Hover App ID.	"Contract deployed. That App ID is its permanent on-chain address."
2:08	Vault — Fund	Click Fund. Sign. Wait for LOCKED.	"Five ALGO moving from my wallet into the smart contract."
2:16	Vault — LOCKED	Status flips to LOCKED.	"Locked. On-chain. Immutable. Waiting for release conditions."
2:22	Lora Explorer	Click Lora link. Transaction loads.	"Look at Lora — contract address, amount, ABI call. This is real. Anyone can verify it right now."
2:32	Lora — txn detail	Show sender, app ID, inner txn. Hold 8s.	[Silence — let the proof speak]
2:42	App — Vault view	Return to app.	
05 — FIVE VAULT TYPES			
2:45	Create Vault modal	Open modal. Hover type dropdown.	"Five vault types. Five programmable trust models."
2:50	Modal — Standard	Select Standard. Show fields.	"Standard — creator locks, agent or creator releases."
2:54	Modal — Time-Locked	Select Time-Locked. Unlock date shows.	"Time-Locked — funds can't move before a date. Contract-enforced, not policy."
2:58	Modal — Multi-Sig	Select Multi-Sig. Co-signer shows.	"Multi-Sig — two wallets must agree before release."
3:02	Modal — Dispute	Select Dispute. Arbitrator shows.	"Dispute-Resolution — third-party arbitrator can intervene."
3:06	Modal — ASA	Select ASA. Asset ID shows.	"ASA-based — lock any Algorand Standard Asset, not just ALGO."
3:11	Modal closing	Close modal.	"All enforced by TEAL on the AVM. No middleman. No override."
06 — AUTONOMOUS AGENT			

TIME	SCREEN	ACTION	VOICEOVER / WORDS
3:15	Dashboard	Scroll to Agent Activity panel.	"This is what makes Unsubscribely different from every other subscription tracker."
3:20	Agent Activity panel	Point at ON-CHAIN badge.	"A dedicated Algorand wallet — the agent — runs every day at midnight UTC."
3:28	Agent entry	Highlight an entry. Show timestamp.	"Scans due subscriptions. Finds the linked vault. Calls release() on the contract. ALGO moves. No click. No reminder. Fully autonomous."
3:42	Lora — agent txn	Click Lora link. Show: agent wallet, release() call, inner payment. Hold 5s.	"The agent signed this. Submitted it. ALGO moved. Publicly verifiable on Lora right now."
3:54	Dashboard	Return. Agent panel visible.	"Every action — timestamped, logged, direct on-chain proof."
07 — ARC-3 NFT RECEIPT			
4:00	Vault Details — released	Open released vault. Mint NFT Receipt. Sign.	"After a vault releases — mint an ARC-3 NFT receipt. Immutable on-chain record."
4:08	NFT receipt card	Show receipt — name, amount, timestamp.	"Payment history not in a database someone controls. On Algorand. Permanently."
08 — AI OPTIMIZER			
4:15	AI Optimizer	Navigate. Click Run Analysis. Wait.	"AI optimizer reads vault data and billing patterns."
4:22	Optimizer results	Show risk scores, recommendations.	"Specific recommendations — cancel, downgrade — based on actual on-chain history. Not guesses."
09 — ON-CHAIN RESUME			
4:35	On-Chain Resume	Navigate. Show vaults, total paid, NFTs.	"Public on-chain resume — shareable, verifiable. Entire payment history on Algorand."
4:44	Public URL	Show public URL in address bar.	"Permanent. Trustless. Yours."
10 — CLOSE			
4:50	Landing — Hero	Cut to hero. Hold 5s.	"Unsubscribely. Programmable money. Transparent payments. Autonomous delivery."
4:56	Black — Logo	Fade to black. Logo centered.	"This is what subscription payments look like when they belong to you."
5:00	End	Hold black.	

PRE-RECORDING CHECKLIST

- | | |
|---|--|
| ☐ Wallet on Algorand Testnet (Pera / Defly / Lute) | ☐ Agent Activity panel has at least one logged action |
| ☐ Min 15 ALGO in wallet — fund at
bank.testnet.algorand.network | ☐ Screen record at 1920x1080 · 60fps |
| ☐ 4+ subscriptions added with realistic names & amounts | ☐ Browser zoom at 90% — all UI fits without scrolling |
| ☐ One locked vault ready (for the vault creation demo) | ☐ Notifications off — Do Not Disturb enabled |
| ☐ One released vault ready (for the NFT mint demo) | ☐ Wallet popup tested — know where it appears on screen |
